Introduction

The Health Behaviour in School-aged Children (Ireland) study is conducted by the HBSC Ireland research team at the Health Promotion Research Centre, National University of Ireland, Galway, Ireland (www.nuigalway.ie/hbsc). HBSC Ireland is one part of the international HBSC research network, which comprises research teams in 41 countries across North America and the European region in collaboration with the World Health Organisation.

The HBSC study is the product of an international network of researchers (www.hbsc.org), who work in topic-focused groups to develop the conceptual underpinnings of the study, identify research questions, discuss and decide on the methods and measurements to be employed and work on data analyses and the dissemination of findings. For each survey round a full research protocol is developed which includes the scientific rationales for topic areas, the international standard questionnaire with recommendations and guidance for translation, layout and question order, along with procedures for sampling, data collection and the preparation of the national data set (Currie *et al.*, 2000; 2004). The international HBSC terms of reference also includes directions for the use of the international dataset and the collaboratively agreed procedures for data dissemination. Adherence to the international protocol is required for entry into the international dataset, and this has been achieved for all data included in this report.

Measurement

The variables and items included in HBSC are chosen on the basis of the overall objectives of the study and on the scientific rationale underlying their use. Questions are subject to both piloting and pre-testing, at international and national level prior to the main survey. The international questionnaire is comprised of both mandatory items, which are employed in all participating countries and optional items, which are included by sub-sets of countries, based on national interest, need and expertise. In addition many countries, including Ireland, add specific national questions, often of historic or local importance.

Sampling

Sampling is conducted in accordance with the structure of the national educational system within countries, and in Ireland is stratified by region, but the primary sampling unit is always the school classroom. Thus the non-independence of students within classrooms is considered in the procedures for sample size calculation, and these are based on the deft values identified in previous survey rounds (Roberts *et al.*, 2000). Children aged 11, 13 and 15 years are the target for the international study, and thus countries time their data collection

HBSC 2006 Full Variable Report

so that that the mean ages within their samples are 11.5, 13.5 and 15.5 years respectively. Sample sizes of 1500 in each age group are required in order to ensure a confidence interval of +/- 3% around a proportion of 50%, and an estimated deft value of 1.2.

As these samples are drawn from schools, and country teams are required to have included at least 95% of children within the age groups in the country in the sample frames, it is frequently necessary to sample across school grades. This is the case in Ireland and thus we have data from children ranging from 5th class in primary schools to 5th year in post-primary schools, spanning the age range 10-18 years. The administration of the questionnaire in schools is conducted according to the standard guidelines from the survey protocol, and in Ireland this is done by teachers in the classrooms. The process of data coding and entry also takes place at national level, according to agreed procedures (Roberts *et al.*, 2007). The data presented in this report come from 215 schools across the country, reflecting a school response rate of 63%, and with a final valid n of 10,334 students. Tables illustrating the demographic representativeness of the 2006 HBSC Ireland sample can be found in appendix 1.

Data Presentation

This variable report presents all data collected as part of the HBSC Ireland 2006 study. Full frequency tables are included for each questionnaire item. In addition, the full frequencies are provided broken down by gender, age and social class, as well as all permutations of these socio-demographic characteristics. Although percentages are provided, it is important to avoid over-interpretation of these data, small differences in reported percentages are likely to fall within the margins of error and thus may not represent reliable or significant differences between groups.

Publications

Previous reports include national data from the 2006 HBSC Ireland study. The first national report contains a selection of the data collected illustrated by gender, age and social class and includes comparative figures from previous surveys (Nic Gabhainn *et al.*, 2007). The second national report explores the health status and behaviours of specific groups of children living in Ireland, including children from the Travelling Community, students from immigrant families, students with a disability or chronic illness and students in DEIS (Delivering Equality of Opportunity in Schools) schools (Molcho *et al.*, 2008).

Appendix 1: DEMOGRAPHIC REPRESENTATIVENESS OF RESPONDENTS

HBSC 2006 survey

The gender breakdown of the HBSC 2006 participants revealed that 51% were male and 49% were female. Those who participated were compared to data from the 2002 census for region and social class. Table 1 presents the final numbers from each geographical region and the percentage of the total sample that this represents. The sixth column presents the percentages of 7-11 years olds recorded in the regions during the 2002 census. The data are representative of the population distribution across regions with only slight variations from the 2002 census.

Table 1: Comparison of the location of 2002 and 2006 HBSC respondents to the 2002 census

Health Board	N		%		%
	HBSC 2002	HBSC 2006	HBSC 2002	HBSC 2006	Census 2002
East	1765	3055	31	30	33
North East	377	633	7	6	10
South East	565	1646	10	16	11
North West	586	704	10	7	6
South	826	1450	15	14	15
Mid West	573	914	10	9	9
West	544	1427	10	14	10
Midlands	412	395	7	4	6

In addition, social class was compared with those presented in the 2002 census, as shown in Table 2. It should be noted that slight variations would be expected here because the census reports all persons by social class, not all of whom would be parents or guardians of children in these age groups.

Table 2: Comparison of the social class of 2002 and 2006 HBSC respondents to the 2002 census
